第 1 章 Group theory

1.1 Introduction

定义 1.1 (Group)

1. The binary operation $*$ is associative.
2. There exists an identity element in G .
3. Each element in G has an inverse.

例题 1.1 $(\mathbb{Z}, +)$: the set of all integers forms a group under addition.

例题 1.2 (\mathbb{Q}^*, \times) : the set of all nonzero rational numbers forms a group under multiplication.

第 2 章 Basic concepts

2.1 Set and Mapping

2.1.1 Set

定义 2.1 (Set)

1. A set is a **Well-defined** collection of objects; while are called the elements of the set.
2. The objects that belong to a set are called its elements or members. If an element x belongs to a set A then we denote this fact by writing $x \in A$; otherwise we write $x \notin A$.
3. The number of elements in a set A is denoted by $|A|$, which is called the cardinality of A .

笔记

1. Classical set are based on Boolean logic
2. Every classical set has a sharp boundary
3. classical set can be extended to fuzzy sets

性质 [Representations]

1. A finite set with a small cardinality can be specified by directly listing all of its elements enclosed within curly brackets

$$S = \{x_1, x_2, \dots, x_n\} \quad (2.1)$$

2. Alternatively, a set (possibly infinite) can be specified by stating the property used to determine its elements.

$$S = \{x | x \text{ satisfies properties}\} \quad (2.2)$$

2.1.2 Subsets

定义 2.2 (Subsets)

1. A set B is said to be a subset of a set A , denoted by $B \subseteq A$ (or $A \supseteq B$) if every element of B is also an element of A .
2. If A is a subset of B but is not equal to B , then we say that A is a proper subset of B and write $A \subset B$ (or $B \supset A$).

$$A \subset B \Leftrightarrow A \subseteq B \wedge A \neq B \quad (2.3)$$

 **笔记** The empty set is a subset of every set
Every set is a subset of itself

2.1.3 Set operations

定义 2.3 (operations)

1. Union= $A \cup B = \{x | x \in A \vee x \in B\}$
2. Intersection= $A \cap B = \{x | x \in A \wedge x \in B\}$
3. Difference= $A \setminus B = A \cap B' = \{x = x \in A \wedge x \notin B\}$
4. Complement= $A' = \{x | x \in U \wedge x \notin A\} = \{x | x \in U : \neg(x \in A)\}$

定义 2.4 (Mappings)

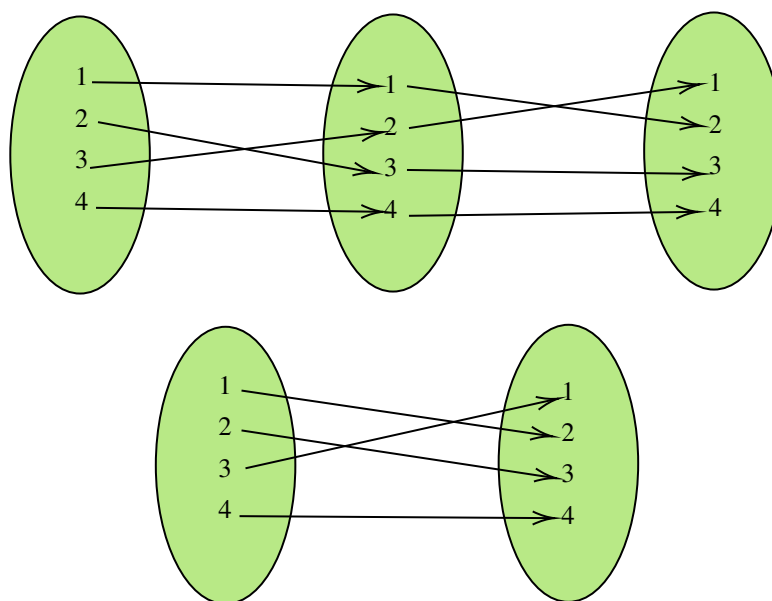

1. Let A and B be sets. A mapping $f: A \rightarrow B$ from A to B assigns to each element x in A exactly one element $f(x)$ in B . The set A is called the domain of the mapping f , and the set B is called the co-domain of the mapping f .
2. Let $f: A \rightarrow B$ be a mapping and C be a subset of A . The image of C under f is the set $f(C) = \{f(x) : x \in C\}$. In particular, the set $f(A)$ is also known as the range of the mapping f . The inverse image of a subset D of B is the set $f^{-1}(D) = \{a \in A : f(a) \in D\}$.

**定义 2.5 (Basic properties of mappings)**

1. A mapping $f: A \rightarrow B$ is surjective (or onto) if $f(A) = B$. We say that f is injective (or one-to-one) if $a \neq b$ implies $f(a) \neq f(b)$. A mapping is called bijective if it is both injective and surjective.
2. Note that $f: X \rightarrow Y$ is bijective if and only if, given any element b in Y , there exists exactly one element a in X with $f(a) = b$. The identity map on A is a mapping $\text{id}_A: A \rightarrow A$ such that $\text{id}_A(x) = x$ for all x in A .

**定义 2.6 (Composition of mappings)**

1. Let $f: A \rightarrow B$ and $g: B \rightarrow C$ be mappings. The composition of f and g is a mapping $g \circ f: A \rightarrow C$ defined by $(g \circ f)(x) = g(f(x))$ for all x in A .
2. A mapping $g: B \rightarrow A$ is called an inverse mapping of the mapping $f: A \rightarrow B$ if $g \circ f = \text{id}_A$ and $f \circ g = \text{id}_B$. A mapping is said to be invertible if it has an inverse. The inverse of f is denoted by f^{-1} .

**例题 2.1**

注 The functions f and g are composed to yield a new composite function $g \circ f$

定理 2.1

Let $f: A \rightarrow B, g: B \rightarrow C$, and $h: C \rightarrow D$. Then

1. The composition of mappings is associative; that is, $(h \circ g) \circ f = h \circ (g \circ f)$.
2. If f and g are both one-to-one, then the mapping $g \circ f$ is one-to-one;
3. If f and g are both onto, then mapping $g \circ f$ is onto;
4. If f and g are bijective, then so is $g \circ f$.

定理 2.2

A mapping is invertible if and only if it is both one-to-one and onto.

2.2 Cartesian products

定义 2.7

Given sets X and Y , the Cartesian product of the sets X and Y , denoted by $X \times Y$, is the set of all ordered pairs (a, b) with a in X and b in Y .

笔记 The cartesian product $X_1 \times X_2 \times \cdots \times X_n$ of the sets X_1, X_2, \cdots, X_n consists of all n -tuples (a_1, a_2, \cdots, a_n) with a_i in X_i for $i=1, 2, \dots, n$. If $X = X_1 = X_2 = \cdots = X_n$ their Cartesian product is simply written as X^n .

2.3 Binary relation

定义 2.8 (binary)

1. A binary operation on a nonempty set A is a mapping, be written as $A \times A \rightarrow A$
2. A binary operation $*$ on A is associative if $(ab)c=a(bc)$ for all $abc \in A$
3. A binary operation $*$ on A is comulative of $ab=ba$ for all $abc \in A$

定义 2.9 (identity)

Let $*$: $A \times A \rightarrow A$ be a binary operation A

1. if $l \in A, la=a$ l is left identity
2. if $l \in A, al=a$ l is right identity
3. if $l \in A, al=la=a$ l is identity

定理 2.3

if l and r respectively left and right identity in A , then $l = r$ is an identity

定理 2.4

The identity is unique in A if it exist.

证明 Assume A has more than a identity, e_1, e_2, \dots, e_n

we know :

$$e_1 = e_1 \cdot e_2 = e_2$$

$$e_3 = e_2 \cdot e_3 = e_3$$

$$\vdots$$

$$e_{n-1} = e_{n-1} \cdot e_n = e_n$$

so $e_1 = e_2 = \dots = e_n$, the identity is only one, if it exists.

定义 2.10

Let R be a binary relation between A and B . If $(a,b) \in R$, then we say that a is R -related to b (or a, b are R -related), which is denoted by $a R b$.

注 The domain of R is the set of all $x \in A$ such that $x R y$ for some $y \in B$. The range of R is the set of all $y \in B$ such that $x R y$ for some $x \in A$.

例题 2.2 Let $A = \{\text{Gardner, Valerian, Olivia, Frank, Daisy}\}$ and $B = \{\text{London, Berlin, Paris, Boston}\}$. Suppose that:

1. Gardner and Valerian were born in London;
2. Olivia was born in Boston;
3. Frank and Daisy were born in Paris.

证明 The above information can be described in terms of a binary relation R given by:

$$R = \{(\text{Gardner}, \text{London}), (\text{Valerian}, \text{London}), (\text{Olivia}, \text{Boston}), (\text{Frank}, \text{Paris}), (\text{Daisy}, \text{Paris})\}$$

性质 A binary relation R on A is said to be:

- reflexive $\Leftrightarrow \forall x \in A, x R x$.
- irreflexive (or strict) $\Leftrightarrow \forall x \in A, \neg(x R x)$
- symmetric $\Leftrightarrow \forall x, y \in A, x R y \Rightarrow y R x$.
- antisymmetric $\Leftrightarrow \forall x, y \in A, (x R y) \wedge (y R x) \Rightarrow x = y$
- asymmetric $\Leftrightarrow \forall x, y \in A, x R y \Leftrightarrow \neg(y R x)$.
- transitive $\Leftrightarrow \forall x, y, z \in A, (x R y) \wedge (y R z) \Rightarrow x R z$.
- complete $\Leftrightarrow \forall x, y \in A, x \neq y \Rightarrow (x R y) \vee (y R x)$.
- total (or strong complete) $\Leftrightarrow \forall x, y \in A, (x R y) \vee (y R x)$.

例题 2.3

1. The relations $=, \leq$ and \geq are reflexive.
2. The relations $<$ and $>$ are irreflexive.
3. The relations $=$ and “relatively prime” are symmetric.
4. The relations \leq and \geq are antisymmetric.
5. The relations $<$ and $>$ are asymmetric.
6. The relations $=, \leq$ and \geq are transitive
7. The relations $<$ and $>$ are complete but not total
8. The relations \leq and \geq are total.

定理 2.5

Let R be a binary relation on A . Then the following are equivalent:

1. R is antisymmetric.
2. $\forall x, y \in A, (x R y) \wedge (x \neq y) \Rightarrow \neg(y R x)$

证明

$$\begin{aligned} R \text{ is antisymmetric} &\Leftrightarrow \forall x, y \in A, (x R y) \wedge (y R x) \rightarrow x = y \\ &\Leftrightarrow \forall x, y \in A, (x R y) \rightarrow ((y R x) \rightarrow x = y) \text{ (CP rule)} \\ &\Leftrightarrow \forall x, y \in A, (x R y) \rightarrow (x \neq y \rightarrow \neg(y R x)) \\ &\Leftrightarrow \forall x, y \in A, (x R y) \wedge (x \neq y) \Rightarrow \neg(y R x) \end{aligned}$$

定理 2.6

Let R be a binary relation on A . Then the following are equivalent:

1. R is asymmetric.
2. R is antisymmetric and irreflexive.

证明

1. Assume that R is asymmetric, Then we have $(x R y) \Rightarrow \neg(y R x)$. It follows that $\forall x, y \in A, (x R y) \wedge (x \neq y) \Rightarrow \neg(y R x)$, Thus R is antisymmetric, Let $x \in A$. since R is asymmetric, we have $x R y \rightarrow \neg(y R x)$
2. Assume that R is not irreflexive. Then there exists $x_0 \in A$ such that $x_0 R x_0$. It follows that $\neg(x_0 R_0 x_0)$. This lead to a contradiction. Therefore, R is irreflexive
3. Assume that R is antisymmetric and irreflexive, Let $x R y$ for $x, y \in A$, Note first that $x \neq y$ since R is irreflexive thus we have $\neg(y R x)$ since R is antisymmetric. Therefore R is asymmetric

命题 2.1

if $P_1 \Rightarrow P_2$ then $P_2 \rightarrow Q \Rightarrow P_1 \rightarrow Q$

证明 if $P_1 \Rightarrow P_2$:

$$\begin{aligned} (P_2 \rightarrow Q) \rightarrow (P_1 \rightarrow Q) &\Leftrightarrow \neg(P_1 \rightarrow Q) \rightarrow \neg(P_2 \rightarrow Q) \\ &\Leftrightarrow (P_1 \wedge \neg Q) \rightarrow (P_2 \wedge \neg Q) \end{aligned}$$

Since $v(P_1) \leq v(P_2)$, $v(P_1 \wedge \neg Q) \leq v(P_2 \wedge \neg Q)$, Hence $P_1 \Rightarrow P_2$ then $P_2 \rightarrow Q \Rightarrow P_1 \rightarrow Q$

定理 2.7

Let R be a binary relation on A . Then the following are equivalent:

1. R is complete.
2. $\forall x, y \in A, (x = y) \vee (x R y) \vee (y R x)$.

定理 2.8

Let R be a binary relation on A . Then the following are equivalent:

1. R is total.
2. R is reflexive and complete.

笔记 total = reflexive + complete

证明

$$\begin{aligned} (x R y) \vee (y R x) &\Leftrightarrow ((x = y) \wedge (x \neq y)) \wedge (x R y) \wedge (y R x) \\ &\Leftrightarrow ((x = y) \rightarrow (x R y) \wedge (y R x)) \wedge (x \neq y) \rightarrow (x R y) \wedge (y R x) \\ &\Leftrightarrow ((x = y) \rightarrow x R y) \wedge (x \neq y \vee (x R y) \vee (y R x)) \\ &\quad \text{reflexive} \qquad \qquad \text{complete} \end{aligned}$$

2.4 Order relation

命题 2.2

Let \leq be a binary relation on A. Then we say that:

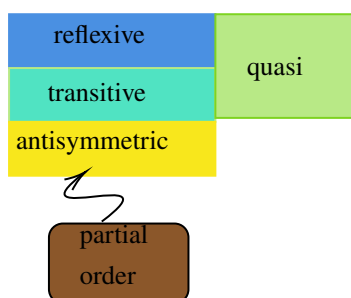

1. \leq is a preorder (or quasi order) $\Leftrightarrow \leq$ is reflexive and transitive.
2. \leq is a weak order $\Leftrightarrow \leq$ is total and transitive
3. \leq partial order $\Leftrightarrow \leq$ is reflexive, antisymmetric and transitive
4. \leq is a total order $\Leftrightarrow \leq$ is total, antisymmetric and transitive
5. \leq is a strict partial order $\Leftrightarrow \leq$ is irreflexive and transitive
6. \leq is a strict total order $\Leftrightarrow \leq$ is irreflexive, complete and transitive

注 Strict total orders are not total orders

定理 2.9

Let \leq be a binary relation on A. Then the following are equivalent:

1. \leq is a partial order
2. \leq is an antisymmetric preorder.

定理 2.10

Let \leq be a binary relation on A. then:

1. \leq is a weak order
2. \leq is a complete preorder

证明

$\Leftrightarrow R$ is a complete, reflexive and transitive

$\Leftrightarrow R$ is total and transitive

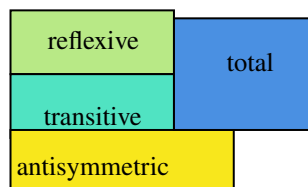

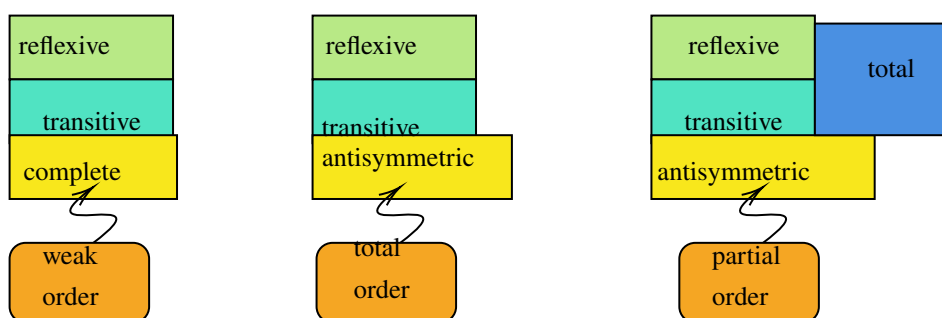

$\Leftrightarrow R$ is weak order

定理 2.11

Let \leq be a binary relation on A , Then:

1. \leq is a total order
2. \leq is a complete partial order
3. \leq is an antisymmetric weak order

笔记

2.5 Equivalence relation

定理 2.12

A binary relation R on A is called an equivalence relation if it is reflexive, symmetric and transitive. For $a \in A$, the set $[a]_R = \{b \in A \mid aRb\}$ is called the equivalence class of a under R .

例题 2.4¹ The equivalence class of (a,b) under cross-multiplication, where $a,b \in \mathbb{Z}$ and $b \neq 0$, is:

$$[(a, b)] = \{(c, d) : ad = bc\}$$

If we denote $[(a,b)]$ by a/b , then this equivalence class is precisely the fraction usually denoted by a/b . After all, it is plain that $(1,2) \neq (2,4)$, but $[(1,2)] = [(2,4)]$; that is, $\frac{1}{2} = \frac{2}{4}$.

例题 2.5 An equivalence class $[(P,Q)]$ of arrows, as in Example 2.17(iv), is called a vector; we denote it by $[(P,Q)] = \overrightarrow{PQ}$.

引理 2.1

If \equiv is an equivalence relation on a set X , then $x \equiv y$ if and only if $[x] = [y]$.

证明 Assume that $x \equiv y$. If $z \in [x]$, then $z \equiv x$, and so transitivity gives $z \equiv y$; hence $[x] \subseteq [y]$. By symmetry, $y \equiv x$, and this gives the reverse inclusion $[y] \subseteq [x]$. Thus, $[x] = [y]$. Conversely, if $[x] = [y]$, then $x \in [x]$, by reflexivity, and so $x \in [y]$. Therefore, $x \equiv y$.

¹A first course in Abstract algebra.98

定理 2.13

Let R be an equivalence relation on A . Then

$$A/R = \{[a]_R | a \in A\}$$

is called the quotient set of A by R .

定理 2.14

Let R be an equivalence relation on A . Then the following are equivalent:

1. $a R b$
2. $b \in [a]_R$
3. $[a]_R = [b]_R$

定义 2.11

Let R be an equivalence relation on A . Then either $[a]_R = [b]_R$ or $[a]_R \cap [b]_R = \emptyset$ for all $a, b \in A$.

笔记² A partition of a set X is a family of nonempty pairwise disjoint subsets, called blocks, whose union is all of X . Notice that if X is a finite set and A_1, A_2, \dots, A_n is a partition of X , then

$$|X| = |A_1| + |A_2| + \dots + |A_n|$$

We are now going to prove that equivalence relations and partitions are merely different views of the same thing

命题 2.3

If \equiv is an equivalence relation on a set X , then the equivalence classes form a partition P of X . Conversely, given a partition of X , there is an equivalence relation on X whose equivalence classes are the blocks in P .

证明³ Assume that an equivalence relation \equiv on X is given. Each $x \in X$ lies in the equivalence class $[x]$ because \equiv is reflexive; it follows that the equivalence classes are nonempty subsets whose union is X . To prove pairwise disjointness, assume that $a \in [x] \cap [y]$, so that $a \equiv x$ and $a \equiv y$. By symmetry, $x \equiv a$, and so transitivity gives $x \equiv y$. Therefore, $[x] = [y]$, by the lemma, and so the equivalence classes form a partition of X .

Conversely, let P be a partition of X . If $x, y \in X$, define $x \equiv y$ if there is $A \in P$ with $x \in A$ and $y \in A$. It is plain that \equiv is reflexive and symmetric. To see that \equiv is transitive, assume that $x \equiv y$ and $y \equiv z$; that is, there are $A, B \in P$ with $x, y \in A$ and $y, z \in B$. Since $y \in A \cap B$, pairwise disjointness gives $A = B$ and so $x, z \in A$; that is, $x \equiv z$. We have shown that \equiv is an equivalence relation.

It remains to show that the equivalence classes are the subsets in P . If $x \in X$, then $x \in A$ for some $A \in P$. By definition of \equiv , if $y \in A$, then $y \equiv x$ and $y \in [x]$; hence, $A \subseteq [x]$. For the reverse inclusion, let $z \in [x]$, so that $z \equiv x$. There is some B with $x \in B$ and $z \in B$; thus, $x \in A \cap B$. By pairwise disjointness, $A = B$, so that $z \in A$, and $[x] \subseteq A$. Hence, $[x] = A$. •

定义 2.12

Let R be an equivalence relation on A . Then $\bigcap \{[a]_R | a \in A\} = A$

²A first course in Abstract algebra.99

³A first course in Abstract algebra.99

2.6 Partitions

定理 2.15

Let R be an equivalence relation on A . Then

$$A/R = \{[a]_R | a \in A\}$$

forms a partition of A

定理 2.16

Let $P = \{A_i | i \in I\}$ be a partition of A . Then the binary relation R on A given by

$$aRb \Leftrightarrow \exists i \in I, \{a, b\} \subseteq A_i$$

is an equivalence relation on A .

2.7 Division

定义 2.14

If a and b are integers, then a is a divisor (or **factor**) of b if there is an integer d with $b = ad$ (synonyms are a divides b and also b is a **multiple** of a). We denote this by:

$$a|b$$

证明 Note that $3|6$, because $6 = 3 \times 2$, but that $3 \nmid 5$ (that is, 3 does not divide 5): even though $5 = 3 \times \frac{5}{3} \times 3$, the fraction $\frac{5}{3}$ is not an integer.

定义 2.15

A common divisor of integers a and b is an integer c with $c|a$ and $c|b$. **The greatest common divisor** of a and b , denoted by $\gcd(a, b)$ [or, more briefly, by (a, b)], is defined by:

$$\gcd(a, b) = \begin{cases} 0 & \text{if } a = 0 = b \\ \text{the largest common divisor of } a \text{ and } b & \text{otherwise.} \end{cases}$$

笔记 The notation (a, b) for the gcd is, obviously, the same notation used for the ordered pair. The reader should have no difficulty understanding the intended meaning from the context in which the symbol occurs.

笔记

- If a and m are positive integers with $a|m$, say, $m = ab$, we claim that $a \leq m$. Since $0 < b$, we have $1 \leq b$, because b is an integer, and so $a \leq ab = m$. It follows that \gcd 's always exist.
- If c is a common divisor of a and b , then so is $-c$. Since one of $\sqrt{m}c$ is non negative, the gcd is always nonnegative. It is easy to check that if at least one of a and b is nonzero, then $(a, b) > 0$.

命题 2.4

if p is a prime and b is any integer, then:

$$(p, b) = \begin{cases} p & \text{if } p|b \\ 1 & \text{otherwise.} \end{cases}$$

证明 A common divisor c of p and a is, of course, a divisor of p . But the only positive divisors of p are p and 1, and so

$(p, a) = p$ or 1; it is p if $p|a$, and it is 1 otherwise.

定义 2.16

Let a_1, \dots, a_n be positive integers. The smallest positive integer m which is *divisible by all* a_i ($i = 1, \dots, n$), is called the least common multiple of a_1, \dots, a_n , and is denoted by $m = \text{lcm}(a_1, \dots, a_n)$.

定义 2.17

A positive integer p greater than 1 is said to be prime if 1 and p are the only positive factors of p . An integer $p > 1$ is called a composite number if it is not prime.

定理 2.17

Every integer $n \geq 2$ is either a prime or a product of primes.

证明 Were this not so, there would be “criminals:” there are integers $n \geq 2$ which are neither primes nor products of primes; a least criminal m is the smallest such integer. Since m is not a prime, it is composite; there is thus a factorization $m = ab$ with $2 \leq a < m$ and $2 \leq b < m$ (since a is an integer, $1 < a$ implies $2 \leq a$). Since m is the least criminal, both a and b are “honest,” i.e.,

$$a = pp'p'' \dots \quad b = qq'q'' \dots$$

where the factors $a = pp'p'' \dots$ $b = qq'q'' \dots$ are primes. Therefore,

$$m = ab = pp'p'' \dots qq'q'' \dots$$

is a product of (at least two) primes, which is a contradiction.

命题 2.5

If $m \geq 2$ is a positive integer which is not divisible by any prime p with $p \leq \sqrt{m}$, then m is a prime.

证明 If m is not prime, then $m = ab$, where $a < m$ and $b < m$ are positive integers. If $a > \sqrt{m}$ and $b > \sqrt{m}$, then $m = ab > \sqrt{m}\sqrt{m} = m$, a contradiction. Therefore, we may assume that $a \leq \sqrt{m}$. By Theorem 2.17, a is either a prime or a product of primes, and any (prime) divisor p of a is also a divisor of m . Thus, if m is not prime, then it has a “small” prime divisor p ; i.e., $p \leq \sqrt{m}$. The contrapositive says that if m has no small prime divisor, then m is prime.

笔记 can be used to show that 991 is a prime. It suffices to check whether 991 is divisible by some prime p with $p \leq 991 \approx 31.48$; if 991 is not divisible by 2, 3, 5, ..., or 31, then it is prime.

定义 2.18

Two integers are relatively prime if their greatest common divisor is 1. The integers a_1, \dots, a_n are pairwise relatively prime if $\gcd(a_i, a_j) = 1$ whenever $1 \leq i < j \leq n$.

例题 2.6 Determine whether 10, 17 and 21 are pairwise relatively prime.

sol: Since $\gcd(10, 17) = \gcd(10, 21) = \gcd(21, 17) = 1$, we deduce that they are pairwise relatively prime.

定理 2.18

Let a, b, c be integers. Then

1. $a|b \wedge a|c \Rightarrow \forall x, y \in \mathbb{Z}, a|(xb + yc)$;
2. $a|b \Rightarrow a|bc$;
3. $a|b \wedge b|c \Rightarrow a|c$;

证明 Assume that $b + c = a(d_1 + d_2)$. Thus there exist $d_1, d_2 \in \mathbb{Z}$ such that $b = ad_1$ and $c = ad_2 = (ad_1)d_2$. Hence $a|c$.

We will give a direct proof of (1). Suppose that $a|b$ and $a|c$. Then, from the definition of divisibility, it follows that there

are integers s and t with $b = as$ and $c = at$. Hence,

$$b + c = as + at = a(s + t).$$

Integers Divisible by the Positive Integer d .

定理 2.19 (Division Algorithm)

Let a and d be integers with $d > 0$. Then there are unique integers q, r such that

$$a = dq + r$$

with $0 \leq r < d$. We refer to a, d, q, r as dividend, divisor, quotient and remainder, respectively.

2.8 Well ordering principle

定义 2.19

The pair (A, \leq) is called a partially ordered set, or simply a poset, if \leq is a partial order on A .

定义 2.20

The pair (A, \leq) is called a totally ordered set, or simply a chain, if \leq is a total order on A .

定义 2.21

Let (A, \leq) be a poset and $B \subseteq A$. Then

1. $l \in B$ is called the minimum in B if $l \leq b$ for all $b \in B$.
2. $g \in B$ is called the maximum in B if $b \leq g$ for all $b \in B$.

定义 2.22

Let (A, \leq) be a poset and $B \subseteq A$. Then

1. $n \in B$ is minimal in $B \Leftrightarrow \neg(\exists b \in B, b < n)$.
2. $m \in B$ is maximal in $B \Leftrightarrow \neg(\exists b \in B, b > m)$.

定理 2.20

Let (A, \leq) be a poset and $B \subseteq A$. Then $n \in B$ is minimal in $B \Leftrightarrow \exists b \in B, b \leq n \rightarrow b = n$.

定理 2.21

Let (A, \leq) be a poset and $B \subseteq A$. Then $n \in B$ is maximal in $B \Leftrightarrow \forall b \in B, m \leq b \rightarrow b = m$.

定义 2.23

A totally ordered set (A, \leq) is called a well ordered set if every nonempty subset of A has a least element.

定理 2.22 (Well ordering principle)

Every nonempty subset of \mathbb{N} has a least element.

笔记 The set of natural numbers is well ordered.

定理 2.23 (principle of Mathematical Induction)

Let S be a subset of natural numbers such that

1. $0 \in S$;
2. $n \in S \Rightarrow n+1 \in S$

then $S = \mathbb{N}$;

注 Why Mathematical Induction is Valid? ⁴Why is mathematical induction a valid proof technique? The reason comes from **the well-ordering property**, listed in Appendix 1, as an axiom for the set of positive integers, which states that every nonempty subset of the set of positive integers has a least element. So, suppose we know that $P(1)$ is true and that the proposition $P(k) \rightarrow P(k+1)$ is true for all positive integers k . To show that $P(n)$ must be true for all positive integers n , assume that there is at least one positive integer for which $P(n)$ is false. Then the set S of positive integers for which $P(n)$ is false is nonempty. Thus, by the well-ordering property, S has a least element, which will be denoted by m . We know that m cannot be 1, because $P(1)$ is true. Because m is positive and greater than 1, $m-1$ is a positive integer. Furthermore, because $m-1$ is less than m , it is not in S , so $P(m-1)$ must be true. Because the conditional statement $P(m-1) \rightarrow P(m)$ is also true, it must be the case that $P(m)$ is true. This contradicts the choice of m . Hence, $P(n)$ must be true for every positive integer n .

定理 2.24 (Strong Induction)

To prove that $P(n)$ is true for all positive integers n , where $P(n)$ is a propositional function, we complete two steps:

1. We verify that the proposition $P(1)$ is true.
2. We show that the conditional statement $[P(1) \wedge P(2) \wedge \cdots \wedge P(k)] \rightarrow P(k+1)$ is true for all positive integers k .

笔记 Strong induction is sometimes called **the second principle of mathematical induction** or **complete induction**.

2.9 Modular arithmetic

定义 2.24

Let $a, n \in \mathbb{Z}$ with $n > 0$. We denote by $a \bmod n$ the remainder when a is divided by n .

**定义 2.25**

Let $a, b, n \in \mathbb{Z}$ with $n > 0$. We say that a is congruent to b modulo n , which is denote by $a \equiv b \pmod{n}$, if $n \mid (a - b)$.

**定理 2.25**

Let n be a positive integer. Then the congruent modulo n relation is an equivalence relation on \mathbb{Z} .

**证明**

- reflexive:
- transitive:
- symmetric:

⁴Discrete mathematics and its applications

定义 2.26

Let n be a positive integer. Then the quotient set

$$Z_n = \{\bar{0}, \bar{1}, \dots, \overline{n-1}\} = Z/R_n$$

is called the set of residue classes of integers modulo n , where R_n is the congruent modulo n relation.

定理 2.26

Let $a, b, c, d, n \in \mathbb{Z}$ with $n > 0$. Then

1. $a \equiv b \pmod{n} \wedge c \equiv d \pmod{n} \Rightarrow a + c \equiv b + d \pmod{n}$.
2. $a \equiv b \pmod{n} \wedge c \equiv d \pmod{n} \Rightarrow a \cdot c \equiv b \cdot d \pmod{n}$.

2.10 Groups

2.10.1 Binary operations

定义 2.27

A binary operation on a nonempty set A is a mapping $\odot: A \times A \rightarrow A$.

A binary operation \odot on A is associative if $a(bc) = (ab)c$ for all $a, b, c \in A$. A binary operation \odot on A is commutative if $ab = ba$ for all $a, b \in A$.

定义 2.28

Let $\odot: A \times A \rightarrow A$ be a binary operation on A . Then

1. An element $l \in A$ is called a left identity if $la = a$ for all $a \in A$.
2. An element $r \in A$ is called a right identity if $ar = a$ for all $a \in A$.
3. An element $e \in A$ is called an identity if $ae = ea = a$ for all $a \in A$.
4. An element $a \in A$ is called an idempotent if $a^2 = a, \exists a \in A$.

定理 2.27

Let $\odot: A \times A \rightarrow A$ be a binary operation on A . If l and r are respectively left and right identities in A , then $l=r$ is an identity

定理 2.28

Let $\odot: A \times A \rightarrow A$ be a binary operation on A . Then the identity in A is unique if it exists.

2.10.2 Semigroups

定义 2.29 (Groupoid(群胚))

A groupoid (G, \odot) is a nonempty set together with a binary operation \odot on G .

定义 2.30 (Semigroups(半群))

A groupoid (G, \odot) is called a semigroup if the operation \odot is associative.

定义 2.31 (monoid(么半群))

A semigroup (G, \odot) is called a monoid if it contains an identity.

注 Group has only one idempotent. But probability has not one idempotent.

例题 2.7 $A = [0, 1], a \vee b = \max\{a, b\}, S' = (A, \vee)$, we can know

$$\forall a \in A \quad a \vee a = a \Rightarrow aRa = a$$

The idempotent has more than one in semigroup.

定义 2.32 (Abelian(阿贝尔群))

A semigroup (G, \odot) is said to be Abelian if the operation \odot is commutative.

2.10.3 Groups

定义 2.33

A monoid (G, \odot) with identity e is called a group if for every a in G , there exists b in G such that $ab=ba=e$. The element b , denoted by $b=a^{-1}$, is called the inverse of a .

定义 2.34

The order of a group (G, \odot) is the cardinality of the set G .

例题 2.8

1. groups $(\mathbb{Z}, +)$, The identity is 0. Inverse is $-a$.
2. groups (\mathbb{Q}^*, \cdot) , The identity is 1. Inverse is $1/a$.
3. $GL(n, \mathbb{R}) = \mathbb{R}^{n \times n} = A$ is an $n \times n$ real matrix is a groups under the multiplication

命题 2.6

1. The identity e is unique.
2. The inverse a^{-1} is unique for each a in G .
3. The inverse of a^{-1} is the element a .
4. The inverse of ab is the element $b^{-1}a^{-1}$.
5. The identity e is the unique idempotent element in G
6. For all $a, b, c \in G$, $ab=ac \Rightarrow b=c$
7. For all $a, b, c \in G$, $ba=ca \Rightarrow b=c$
8. For $a, b \in G$, the equations $ax=b$ and $ya=b$ have unique solutions $x=a^{-1}b$ and $y=ba^{-1}$, respectively.

证明

1. Assume that e_1 and e_2 are both identities. so

$$e_1 = e_1 * e_2 = e_2$$

the identity is unique.

2. Assume that a_1^{-1}, a_2^{-1} are both inverses. we know

$$a_1^{-1} * (e) = a_1^{-1} * (a * a_2^{-1}) = e * a_2^{-1} = a_2^{-1}$$

3. According definition, We can know a^{-1} is inverse of a
4. Note first $ab * (b^{-1}a^{-1}) = e$, so The inverse of ab is the element $b^{-1}a^{-1}$
5. Note first that e is idempotent. If $a^2 = a$, then we can deduce that $e = a^{-1}a = a^{-1}a^2 = ea = a$
6. If $ab=ac$, then we have

$$b = eb = (a^{-1}a)b = a^{-1}ac = c$$

7. etc

8. if $ax=b$ and $ya=b$ we have

$$x = ex = (a^{-1}a)x = a^{-1}ax = a^{-1}b$$

定理 2.29

A semigroup (G, \odot) is a group if and only if it satisfies the following:

1. G has a left identity l ;
2. for all $a \in G$, $\exists a^* \in G$ such that $a^* a = l$

证明 \Rightarrow Obviously that is true

\Leftarrow Assume that G is (G, \odot) is a semigroup such that $ax=b$ and $ya=b$. Given $b_0 \in G$, the equation $yb_0 = b_0$ is a solution $y=l$. For every $a \in G$, the equation $b_0 x = a$ as a solution $x=c_0$. It follows that $la=l(b_0 c_0) = b_0 c_0 = a$, which shows that l is not only a left identity but also that the equation $ya=l$ has a solution $y=a^*$ the left inverse of a . Therefore G is a group.

Similarly we can conclude that:

定理 2.30

A semigroup (G, \odot) is a group if and only if it satisfies the following:

1. G has a right identity r
2. for all $a \in G$, $\exists a^* \in G$ such that $aa^*=r$.

定理 2.31

A semigroup (G, \odot) is a group if and only if for all $a, b \in G$, the equations $ax=b$ and $ya=b$ have solutions in G

证明 \Rightarrow Straightforward

\Leftarrow Assume that G is semigroup such that $ax=b$ and $ya=b$ have solutions. Given $b_0 \in G$, the equation $yb_0 = b_0$ has a solution $y=l$. For every $a \in G$, the equation $b_0 x = a$ has a solution $x=c_0$. It follows that $la=l(b_0 c_0) = b_0 c_0 = a$ which shows that l is a left identity. Note that the equation $ya=l$ has a solution $y=a^*$. Hence, a^* is the left inverse of a . According to Theorem 2.29 we know that it is a group.

2.10.4 Subgroup

定义 2.35

A nonempty set H of a group (G, \odot) is called a subgroup of G , denoted by $H \leq G$, if H forms a group under the binary operation \odot of G (restricted to its subset H).

定理 2.32

A nonempty set H of a group (G, \odot) is called a subgroup of G , denoted by $H \leq G$, if it satisfies the following conditions:

1. H contains the identity of G ;
2. For all $x, y \in H$, $xy \in H$; (i.e., $H^2 \subseteq H$)
3. For all $x, y \in H$, $xy^{-1} \in H$. (i.e., $H^{-1} \subseteq H$)

定义 2.36

A nonempty set H of a group (G, \circ) is called a subgroup of G , if it satisfied

1. $\forall x, y \in H, xy \in H$
2. H contains the identity of G
3. $\forall y \in H, y^{-1} \in H$

笔记

1. 1,2 can proves the G is submoinod.
2. 1,2,3 can proves the G is subgroup

定理 2.33

H is a sub group of G

1. $H \leq G$
2. $\forall x, y \in H, xy \in H$ and $y^{-1} \in H$
3. $\forall x, y \in H, xy^{-1} \in H$

证明 $3 \Rightarrow 1$ Assum that $xy^{-1} \in H$ whenever $x, y \in H$, since $H \neq \emptyset$, there exists some $a \in H$. Thus $e = aa^{-1} \in H$, Hence

$$b^{-1} = eb^{-1} \in H$$

$$ab = a(b^{-1})^{-1} \in H$$

Therefore, $H \leq G$

定理 2.34

If G is a group and $\bigcap_{i \in I} H_i$, then $\bigcap_{i \in I} H_i$ is a subgroup of G .

证明 Let $H = \bigcap_{i \in I} H_i$, if $x, y \in H$, then $x, y \in H_i$, for all $i \in I$.

Thus $xy^{-1} \in H_i \leq G$ for all $i \in I$. Hence $xy^{-1} \in H$. Therefore $H \leq G$.

笔记 The intersection of some subgroups of a group G is also a subgroup of G .

定义 2.37

Let G be a group and $x \in G$. Then

$$\langle x \rangle = \bigcap \{H \mid x \in H \leq G\}$$

is called **the subgroup of G generated by X**

笔记 The subgroup generated by the set X is the smallest subgroup of G containing X .

笔记 $\langle \emptyset \rangle = e$

笔记 G 中的真子群分布是不均匀的，不是一直都是一层包含一层的关系，很大可能是离散的每个群包含的元素有的相同，有的不同，比如 Z_6 中的剩余类群就是不一样的 $(2, 4)$ 和 $(0, 3)$ 。

定义 2.38

Let G be a group and $H = \langle X \rangle \leq G$, Then

1. The elements of X are called the generated of H .
2. H is said to be finitely generated if it has a finite set of generators.
3. H is said to be cyclic if it can be generated by a single generator.

**定理 2.35**

Let G be a group and $\emptyset \neq X \subseteq G$. If H is the set of all finite product of elements in $X \cup X^{-1}$, then H is the subgroup of generated by X .

笔记 The subgroup generated by X contains exactly all the finite product elements in X or X^{-1}

定理 2.36

Let G be a group and $\emptyset \neq X \subseteq G$. Then

$$\langle X \rangle = \{a_1^{k_1} a_2^{k_2} \cdots a_n^{k_n}\}$$

1. $a^0 = e, a^2 = aa, a^{-2} = (a^2)^{-1}$
2. $\langle X \rangle$ contains exactly all the finite product of elements in X or X^{-1}

2.10.5 Homomorphisms

定义 2.39

Let (F, \odot) and $(K, +)$ be semigroups. A mapping $f: G \rightarrow K$ is called a homomorphism if

$$f(a \odot b) = f(a) + f(b)$$

for all $a, b \in G$.

注 A homomorphism between two semigroups is a mapping which is compatible to the binary operation defined on the semigroups

定义 2.40

Let $f: G \rightarrow H$ be a homomorphism. Then f is called

1. a monomorphism if it is injective
2. an epimorphism if it is surjective
3. an isomorphism if it is bijective
4. an endomorphism if $G=H$
5. an automorphism if $G=H$ and f is bijective

定义 2.41

Let G and H be semigroups. Then G is said to be isomorphic to H if there exists an isomorphism from G to H . This is denoted by $G \cong H$

笔记 The relation \cong is an equivalence relation

定义 2.42

Let $f: G \rightarrow K$ be a homomorphism of groups. Then $\text{Im}(f) = f(G)$ is called the homomorphic image of G , and $\text{ker}(f) = f^{-1}(\langle e_K \rangle)$ is called the kernel of f

1. $\text{Ker}(f) = f^{-1}(\{e_K\}) = \{a \in G \mid f(a) = e_K\}$
2. $\text{Ker}(f)$ 是 E_K 原象集
3. $e_G \in \text{Ker}(f)$

证明 $1 \Rightarrow 3$, First assume that f is monomorphism, since $f(e_G) = e_K$, we have $e_G \in \text{Ker}(f) = f^{-1}(\{e_K\})$. Let $a \in \text{Ker}(f)$, Then $f(a) = e_K = f(e_G)$. since f is injective it follows that $a = e_G$, Therefore $\text{Ker}(f) = \{e_G\}$

$3 \Rightarrow 1$ Let a, b belongs to G , $f(a) = f(b)$. Then

$$f(ab^{-1}) = f(a)f(b^{-1}) = f(a)f(a^{-1}) = e_K$$

Thus $ab^{-1} \in \text{Ker}(f) = \{e_G\}$, That is $ab^{-1} = e_G$, Hence $a = (b^{-1})^{-1} = b$, Therefore f is a monomorphism

注 Let G be an Abelian group consider the mapping $f: G \rightarrow G$ given by

$$f(x) = x^{-1}$$

Show that f is an automorphism of groups

定义 2.43

Let $f: G \rightarrow K$ be a homomorphism of groups. Then $\text{Im}(f) = f(G)$ is called the homomorphic image of G , and $\text{Ker}(f) = f^{-1}(\{e_K\})$ is called the kernel of f

例题 2.9 Let $3Z = \{3n | n \in \mathbb{Z}\}$. It can be seen that $3Z$ is a subgroup of the additive group of integers. Consider the mapping $f: \mathbb{Z} \rightarrow 3Z$ given by $f(n) = 3n$. One can verify that f is an isomorphism of groups.

命题 2.7

Let A, B, C be subgroups. Let $f: A \rightarrow B$ and $g: B \rightarrow C$ be mappings. Then we have:

1. If f and g are homomorphisms, then $g \circ f$ is a homomorphism.
2. If f and g are monomorphisms, then $g \circ f$ is a monomorphism.
3. If f and g are epimorphisms, then $g \circ f$ is an epimorphism.
4. If f and g are isomorphisms, then $g \circ f$ is an isomorphism.

命题 2.8

Let $f: G \rightarrow K$ be a homomorphism of groups. Then we have:

1. $f(e_G) = e_K$.
2. $f(x^{-1}) = (f(x))^{-1}$.

证明

1. Since f is a group homomorphism, $f(e_G)f(e_G) = f(e_G e_G) = f(e_G)$, This shows that $f(e_G)$ is idempotent. Note also that e_K is the unique idempotent in K , Thus $f(e_G) = e_K$.
2. let $x \in G$, since

$$f(x) \cdot f(x^{-1}) = f(e_G) = e_K \Rightarrow f(x) = (f(x^{-1}))^{-1}$$

—

笔记 The identity and inverses are preserved under the homomorphism of groups

命题 2.9

Let $f: G \rightarrow K$ be a homomorphism of groups. Then we have:

1. $K_1 \leq K \Rightarrow f^{-1}(K_1) \leq G$.
2. $G_1 \leq G \Rightarrow f(G_1) \leq K$.

证明

1. Note first that $f^{-1}(K_1) \neq \emptyset$, since $f(e_G) = e_K \in K_1 \leq K$. Let $x, y \in f^{-1}(K_1)$. Then $f(x), f(y) \in K_1$, since $K_1 \leq K$, it follows that $f(x)f(y)^{-1} = f(x)f(y^{-1}) = f(xy^{-1}) \in K_1$, Thus $xy^{-1} \in f^{-1}(K_1)$, Which shows that $f^{-1} \leq G$.
2. Note first that $f(G_1) \neq \emptyset$ since $e_K = f(e_G) \in f(G_1)$. If $x, y \in G_1 \leq G$ and $f(xy_1^{-1}) = f(x_1)f(y_1^{-1}) = f(x_1)f(y_1)^{-1} = xy^{-1} \in f(G_1)$. Hence $f(G_1) \leq K$.

2.10.6 Cyclic groups

定义 2.44

Let G be a group and $X \subseteq G$. Then

$$\langle X \rangle = \cap \{H | X \subseteq H\}$$

is called the **subgroup of G generated by X**

定义 2.45

Let G be a group and $H \leq G$. Then H is said to be cyclic if $H = \langle a \rangle$ for some a in H

定义 2.46

Let G be a group and $a \in G$. The order of the element a , denoted by $|a|$, is the order of the cyclic groups generated by a

定义 2.47 (cyclic groups)

Let n be a positive integer. Then the quotient set

$$Z_n = \{\bar{0}, \bar{1}, \dots, \overline{n-1}\}$$

例题 2.10 we can know the equation that $\bar{r} = \{k \in Z | r \equiv k \pmod{n}\} = \{k \in Z | \text{mod } n = r\}$

The set Z forms a groups under the binary operation:

$$\bar{r} + \bar{s} = \overline{r+s}$$

例题 2.11

1. The additive groups of integers is an infinite cyclic group generated by the generator 1.
2. The groups Z_n consisting of all the residue classes of integer modulo n is a finite cyclic group generated by the generator $\bar{1}$

例题 2.12 Consider the residue class groups Z_6 . As shown in the foregoing, $\{\bar{0}, \bar{3}\}$ and $\{\bar{0}, \bar{2}, \bar{4}\}$ are subgroups of Z_6 . In addition, it is easy to verify the following facts:

$$|\bar{3}| = |\langle \bar{3} \rangle| = |\{\bar{3}, \bar{0}\}| = 2$$

$$\bar{0} + \bar{2} + \bar{4} = \bar{3}$$
